

AgentFlow+ version 1.6 · macOS

US\$10,000

per year · single-user licence
updates and support included
no usage fees

Build, govern and run AI agents on your Mac.

The AI Agent Workflow Manager for macOS: visual workflows, 25 ready-made agents, a built-in Skill Studio and governance that is enforced at every step. Nothing leaves your Mac unless you decide it should.

Workflows that survive anything

Branches, parallel steps, loops, sub-workflows, typed outputs with schema checks, retries and fallbacks. Every step is saved as it completes: resume after a crash, re-run from any step, export to Word.

Agents and assistants, day one

25 agents in seven categories, including a 15-agent AI Reasoning library. Any agent becomes an assistant people talk to; every answer shows its tools, skill releases and cost.

Approvals you can prove

An approval stores what was shown and what was approved. Edit before approving — the edit is what runs. A changed payload is refused. External writes never repeat on retry. Hash-chained event log.

Skill Studio, built in

Describe → Specify → Generate → Edit → Test → Release. Trials and a no-skill baseline, security scan, originality check, kits for Claude, Agensi.io, SkillsMP and AI Skill Market.

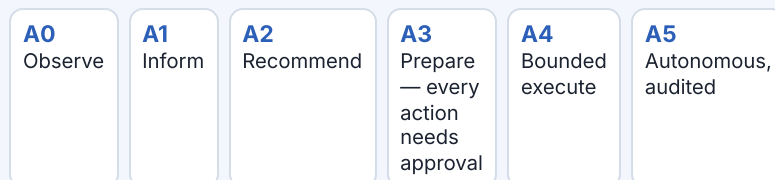

Engagements and assurance

Scored use cases, evaluation datasets graded by rules, an LLM judge or a human, a 12-attack injection suite, release gates, shadow mode and a Word handover in English or French.

Operations

Cost per successful outcome, schedule / webhook / folder triggers, HTTP connectors, MCP tool servers, incidents, agent memory and policies by data classification.

SIX AUTONOMY LEVELS, ONE DIAL

The effective level of any step is the lowest of the agent, the node, the workflow ceiling and the organisation-wide ceiling. Chats are capped at A2. Emergency stop halts everything.

BUILT FOR

- Consultants delivering AI automation to clients, from scoped use case to signed-off handover
- Risk, compliance, audit and security professionals who need evidence
- Solutions and forward-deployed engineers running several customer projects
- Skill authors selling on the marketplaces; educators and researchers

Local by design. One folder on your Mac, keys in the macOS Keychain, per-launch server token, no telemetry.

Bring your own model. Anthropic, any OpenAI-compatible endpoint, or fully local with Ollama.

Tested. 211 automated tests, a shipped reference workflow that proves the governance path end to end. English and French.
